## LightShip

Adding low-energy internal lighting to a boat can be a difficult and expensive proposition. Not any more! Just stick a solar powered LightShip to the inside of any hatch, window or porthole with good sun access and you'll have light all night long. The LightShip has three suction cups to securely stick it to any smooth hatch surface and the waterproof, lightweight 8 oz. unit contains a tiny solar panel, rechargeable NiMH battery pack, and both white and red super-efficient LEDs.

With just an 8-hour charge in medium-to-bright sunlight the LightShip will easily last all night long. Any time there's light, it's charging.

Put one near any door, companionway, over your electric panel, in any head or cabin anywhere there's a nearby clear glass window, hatch, porthole or smooth surface to stick it to. You can even attach one to a window for charging during the day, then move it to wherever you need light at night. Get several and keep your boat well lit with absolutely no energy draw on your boat's batteries.

Click the switch to the red LED when you want to preserve your night vision or just add some stateroom ambience; click to the bright white LEDs when you really need to read a chart or check your instruments; or turn it off altogether if you want total darkness. The built-in light sensor automatically turns the LightShip off whenever there's enough available light for charging.

The LightShip is made from tough polycarbonate, has an internal reflector as well as fresnel-type lens, and is available in 6 colors: Ruby Red, Topaz Blue, Diamond Yellow, Emerald Green, Amethyst Purple, and Quartzite Pink. For just \$14.95 you can have a night-light virtually anywhere on your boat.

To order direct just go to [www.shockles.com](http://www.shockles.com) or call 888-557-6464.
